-!- FUNCTION: Bacterial hemolysins are exotoxins that attack blood cell membranes and cause cell rupture. Binds to eukaryotic membranes where it hydrolyzes phosphatidylcholine, sphingomyelin and phosphatidylethanolamine. The diacylglycerol produced can activate both the arachidonic acid pathway, leading to modulation of the inflammatory response cascade and thrombosis, and protein kinase C, leading to activation of eukaryotic phospholipases and

further membrane damage (By similarity).

-!- CATALYTIC ACTIVITY: A phosphatidylcholine + H(2)O = 1,2-
diacyldylceol + choline phosphate.

-!- CATALYTIC ACTIVITY: A phosphatidylcholine + H(2)O = 1,2-
diacyldylceol + choline phosphate.

-!- COPACTOR: Binds 3 zinc and 3 calcium ions (By similarity).

-!- DOWAIN: The protein is composed of 2 domains; the N-terminal domain contains the phospholipaee C active site (PLC), in a cleft which is also occupied by the 3 zinc ions. The C-terminal domain as a putative phospholipid-recognition domain, which shows structural homology with phospholipid-binding C2-like domains from a range of eukaryotic proteins. The ability to bind membrane phospholipids in a Ca(2+) dependent manner and toxicity is conferred by this C-terminal domain, which also contributes to the sphingomyelinase activity (By similarity).

-I- FUNCTION: Bacterial hemolysins are exotoxins that attack blood cell membranes and cause cell rupture. Constitutes an essential virulence factor in gas gangrene. Binds to eukaryotic membranes where it hydrolyzes both phosphatidylcholine and sphingomyelin, causing cell rupture. The diacylglycerol produced can activate both the arachidomic acid pathway. Leading to modulation of the inflammatory response cancade and thrombosis, and protein kinase chilamatory response cacade and thrombosis, and protein kinase C, leading to activation of eukaryotic phospholipases and further

RA MEDILIMESZUSABULY TUDNEGEILUGBILITY

RA MEDILIMESZUSABULY TUDNEGEILUGBILITY

RETUCTURE and function of clostridial phospholipases C.";

MICTOBS INFECT. 21.277-1284 (2000)

- 1- FUNCTION: Bacterial hemolyshus are exotoxins that attack blood

CC - 1- FUNCTION: Bacterial hemolyshus are exotoxins that attack blood

CC - 1- FUNCTION: Bacterial hemolyshus are exotoxins that attack blood

CC - 1- FUNCTION: Bacterial hemolyshus are exotoxins that attack blood

CC - 1- FUNCTION: Bacterial hemolyshus acid pathway, leading to modulation

CC of the inflammanciory response cascade and thrombosis, and procedin

CC of the inflammanciory response cascade and thrombosis, and procedin

Kinase C, leading to activation of eukaryotic phospholipases and

further membrane damage (By similarity). This enzyme is hemolytic

CC - CATALYTIC ACTIVITY: A phosphatidylcholine + H(2)O = 1,2-

diacylglycerol + choline phosphaticy.

CC - CORACTOR: Binds J zinc and 3 calcium ions (By similarity).

- - SUBCELLULAR LOCATION: Secreted (By similarity).

- - SUBCELLULAR is emphased of 2 domains; the N-terminal

CC - CORACTOR: Binds is composed of 2 domains; the N-terminal

CC - DOMAIN: The procein is composed of 2 domains; which shows

STRUCTURAL HORSPHOLIPIES CCC of domains from

a range of eukaryotic proteins. The ability to bind membrane

CC conferred by this C-terminal domain, which also contributes to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          between the Swiss Institute of Bioinformatics and the EMBL outstation the European Bioinformatics Institute. When bound to oxysterols it translocate to the periphery of Golgi membranes.
-!- SIMILARITY: Balongs to the OSBP family.
-!- SIMILARITY: Contains 2 ANK repeats.
-!- SIMILARITY: Contains 1 PH domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Levine T.P., Munro S., hold of the property of the property of the protein of the protein of the protein, to both the Golgi and the nucleus-vacuole junction."; Mol. Claim 6; SEQ ID NO 381; 192pp; French.

of L. The present invention relates to the genome sequence of Listeria monocytogenes EGD-e (see ABA03041). The genome sequence and fragments it are useful for selecting probes and primers for detecting genes in monocytogenes and related organisms, and for studying genes in polymorphisms and other genomes. The present sequence is a protein encoded by the genome sequence of the present invention. Proteins

             antibodies, identification of L. monocytogenes and related organisms, and for blosynthesis and biodegradation, especially biosynthesis of Vitamin Sall. The genome sequence and proteins encoded by it are also useful for selecting compounds that regulate gene expression and cell replication and modulate L. monocytogenes-related diseases. In addition, the genome sequence and proteins encoded by it are useful in pharmaccutical and vaccines compositions for the treatment or prevention of infections by L. monocytogenes and related organisms. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                   Peptides, or conjugates, have the amino acid sequence of the epitopes of C. perfringens alpha-toxin (AT) from amino acids 261-300 but lack hospholiphises C and/or sphingomyelin-hydrolysing activity. The peptides induce a protective immune response against AT when admin. to human or animals. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New proteins and nucleic acid molecules from Streptococcus pneumoniae, useful as medicaments for treating or preventing a disease or infection

```
The invention relates to a protein comprising or having at least 50% identify to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the expressed from 2469 of 2489 identified DNA coding regions from the Streptococcus pneumoniae type 4 strain genomic sequence appearing as ABS56454. Also included are an antibody which binds one of the proteins, treating a patient by administering the protein, DNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid cited above or fragments between nuclectides 8-100 of a sequence not defined in the specification, for amplifying a target sequence the first primer is substantially complementary to the target sequence and where the parts of the primers having substantially complementary to the complement of substantial complementarity define the termin of the target sequence to be amplified, assay comprising contacting a test compound with the protein, and determining whether the test compound binds to the protein protein and a Streptococcus pneumoniae bacterium, where one or more genes encoding the proteins has been rendered inactive. The proteins, nucleic acid molecules, antibody and compositions are useful as medicaments for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         treating or preventing a disease or infection due to streptococcus bacteria, particularly S. pneumoniae, such as pneumonia, sepsis, otitis media or ear infection. They are also useful in developing vaccines, diagnostics and antibiotics. The methods are useful for identifying immunodominant proteins. The present sequence is one of the 2469 proteins expressed by the identified coding regions from the genomic sequence. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fig.wipo.int/pub/published_pct_sequences. (Updated on 23-OCT-2003 to

the invention fractate to an independent of a cell. Also included are:

the foll antisense sequences given in the specification where expression

of the nucleic acid inhibits proliferation of a cell. Also included are:

concluding a polypeptide whose expression is inhibited by the antisense acid encoding a polypeptide whose expression is inhibited by the antisense concluded are:

concluded a not its fragment whose expression is inhibited by the antisense contisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular concluderation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway concluded for the proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profilling a compound; activity; (11) aculture compound that inhibits proliferation of an organism. The antisense nucleic acids required confidentifying proteins or scenarion for homologous nucleic acids required confident proliferation of an organism. The antisense nucleic acids required confident confidence or a conjudent confidence or a conjudent confidence or a conjudent confidence or a conjudence o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the princed specification, but was obtained in electronic format directly from WIPO at
                                                                                            Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Zyskind JW;

                                                                                                                                                                       179 HSKYENFVDTIK------NNYIVSD----SNGYWNWKGANPEDWIEGAAVAA 220
                                                                                                                                                                                     The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oilgomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed somes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in issue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) are useful for treating disorders

involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                       The present invention describes isolated nucleic acid sequences which encode lipid metabolism related proteins (LMRP). The LMRP nucleic acids encan be used to modify lipids and fatty acids, cofactors and enzymes in microorganisms and plants, particularly to produce polyunsaturated fatty acids, and are especially useful in oilseed plants. The nucleic acids may also confer biotic or abiotic stress tolerance, particularly to maize, wheat, rye, oat, triticale, rice, barley, soybeaut, peanut, cotton, rapeseed, canola, manihot, pepper, sunflower, tagetes, potato, tobacco, eggplant, tomato, vicia species, pea, alfalfa, coffee, cacao, tea, Salix species, oil palm, coconut, perennial grasses and forage crops, AMH50878 to AMH50882 represent primers used in the exemplification of the present invention. AMH5082 represent LMRP protein sequences, given in the

                                                                                                                                                                                                 The present invention describes 2 Brevibacillus laterosporus insecticidal secreted proteins designated ISP1A and ISP2A. ISP1A, and ISP2A, are insecticidal to Diabrocica virgifiera larvae when ingested by larvae in combination with the ISP2A amino acid sequence 51 to 457, or ISP1A amino acid sequence 38 to 871, respectively. ISP1A and ISP2A are useful for controlling insects. The polymucleotide sequences encoding ISP1A and ISP2A can be used in the production of transgenic plants resistant to coleopteran insects. The present sequence represents a modified ISP1A-1 protein from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1. .2

```
The present sequence represents a Brevibacillus laterosporus insecticidal secreted protein designated ISP1A. ISP1A, and ISP2A, are insecticidal to Diabrotica virgifera larvae when ingested by larvae in combination with the ISP2A amino acid sequence 51 to 457, or ISP1A amino acid sequence 51 to 811, respectively. ISP1A and ISP2A are useful for controlling insects. The polynucleotide sequences encoding ISP1A and ISP2A can be used in the production of transgenic plants resistant to coleopteran insects
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SRNTTIVNPNETALLANEWRADLENGIYSADYENPY----YDN-STYASHFYDPDT--- 112

(a) amino acid sequence of the smallest active toxin of the protein

comprising a sequence of the smallest active toxin of the protein

comprising a sequence of the protease-digestion fragment of the

cor (b) the amino acid sequence of the protease-digestion fragment of the

protein encoded by the insecticidal secreted protein (isp)1A or isp2A DNA

deposited at the BCM-LMBP under accession number LMBP 4009. Also

included are a DNA sequence encoding the protein cited above, a chimaeric gene comprising the DNA and a plant-expressible promoter region (e.g. the long and short forms of the corn zrp2 gene promoter), a plant cell.

Comprising the chimaeric gene used to produce the protein cited above, a plant or a seed comprising the chimeric gene of integrated in its cells, a process for controlling insects comprising the moderning isplan or ISP2A, a process for controlling insects comprising expressing the protein cited above in cells of a plant, a process for rendering a plant resistant to coleopteran insects (comprising transforming plant cells with a first chimaeric gene and a second chimaric gene, and regenerating transformed plants from the cells which are resistant to insects, where the first and second chimaeric gene are ISP1A and ISP2A, and a process for controlling coleopteran insect pests (comprising planting, sowing or growing in a field plants transformed with a first chimaeric gene and a second chimaeric gene and second chimaeric gene, where the first and second chimaeric gene are ISP1A and ISP2A, and a process for controlling coleopteran insect the first and second chimaeric gene are ISP1A and ISP2A). The insecticidal secreted proteins and DNA sequences are useful in making insecticidal compositions or transgenic plants to protect plants (especially crops like corn) from damage caused by insects particularly coleopteran insects (e.g. Diabrotica sp., Leptinotarsa sp. and Anthonomus sp.). The proteins are useful for preventing or minimising insectic damage to plants in a field. The present sequence represents ISP1A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       --GTTYIPFAKHAKETGAKYFNLAGQAYQNQDMQQAFFYLGLSLHYLGDVNQPMHAANFT 170

(a) amino acid sequence of the smallest active toxin of the protein comprising a sequence appearing as ABU08981 (ISPIA) or ABU08982 (ISPIA); or (b) the amino acid sequence of the protease-digestion fragment of the protein encoded by the insecticidal secreted protein (isp)1A or isp2A DNA deposited at the BCCM-LMBP under accession number LMBP 4009.                                                                                                                                                                                                                  The invention relates to multiprotein complexes from eukaryotes. Proteins of the invention and DNA sequences encoding them are given in records ABR52586-ABR553903 and ACC66010-ACC6144 respectively. The complexes are obtainable by using a protein as a bait and isolating the set of proteins which is attached thereto from cells. Such protein complexes may comprise up to 30 distinct proteins. Protein complexes of the invention are useful for diagnosing a disease or disorder, or as a target for an active agent of a plarmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for this appeared is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office. The complete document is available on CD-ROM

ģ

AAG05009 standard; protein; 192 AA AAG05009; XXXXXXXXXXXXXXXXX

17-OCT-2000 (first entry)

Arabidopsis thaliana protein fragment SEQ ID NO: 1251.

Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
